

FACT SHEET #10

Cattle Crushes

A cattle crush is a strongly built stall or cage for holding cattle, horses, or other livestock safely while they are being examined, marked, or receiving veterinary treatment. Cows may be made to suckle calves in a crush.

A cattle crush is an essential piece of equipment on any farm. It helps to ensure the safety of the animals and the people working with them. They also ensure the quickest, most practical and safest way to handle cattle whether for inspection or veterinary treatment. The crush safely holds an animal still while the entry gates on the side allow access to different parts of the animal for examination and treatment.

Expo-Trade offers a wide selection of crushes that will suit any kind of operation from hobby farmers to major enterprises with very large quantities of cattle. The crushes can be built to order and modified as required to suit your individual specifications.

Our range of crushes begins with simple manually operated versions and extends to fully automated heavy duty hydraulic and pneumatic models that are fully equipped with the latest technologies. These state-of-the-art crushes make the job of cattle handling safe and efficient in a modern herd management system.
